BLOOM

From Cherry to Cup

Where it all began - Story Moodboard

BLOOM tells how coffee is made as a short fantasy

Three 40-second episodes, two minutes in total, delivered through a local website

Why I made it

A cup of coffee hides a long journey: picking, pulping, drying, roasting, grinding and brewing. I wanted to show those steps as a gentle storybook adventure that anyone can follow, led by one girl.
Also, Coffee is my emotional support drink that gets me through my day <3

Objectives

1. Tell harvest, roast and grind, and brew as three short episodes
2. Deliver them through a local website that is easy to navigate
3. Be open about where AI helped, and keep the work my own

One curious girl links every stage of the coffee story

The girl, her wand, basket and the bee return in every scene

1

Rounded forms, warm colour

Soft, toy-like shapes and a warm palette give a miniature storybook feel. Red cherries are the focal point against the green islands.

2

A recurring cast

The same girl, wand, basket and bee carry the story from harvest to roast to brew.

3

Narrated, 40 seconds each

Three episodes at 24 frames per second, with a written script, sound and captions.

Audience: visitors who enjoy visual storytelling and coffee branding (design intent, not a tested finding).

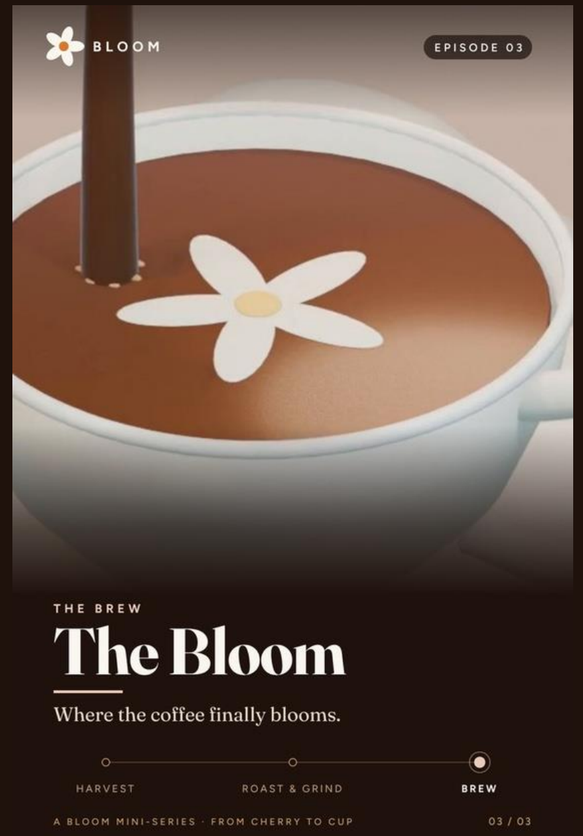

Three episodes follow coffee from cherry to cup

Harvest: the ride, the leap, cherries into the basket.

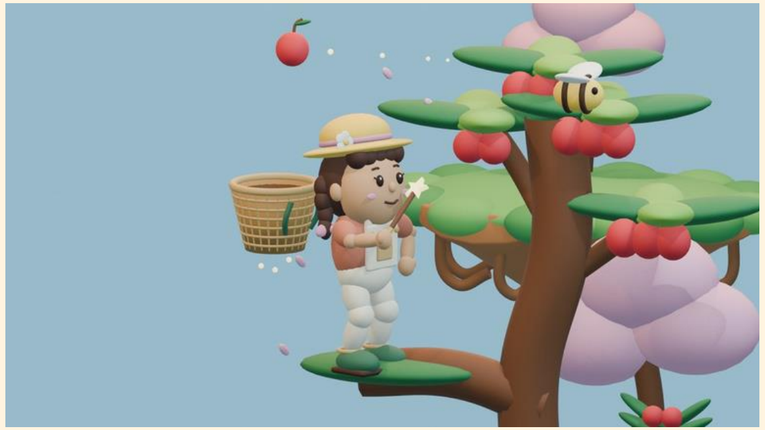

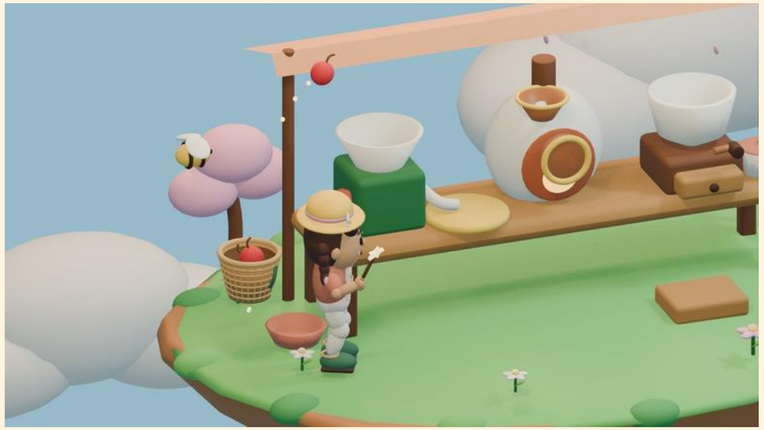

Roast and grind: pulp, dry, roast, then the grinder.

Brew: coffee, milk and a blossom on the cup.

Time to Jump into the series!

Let’s indulge in...

Harvest, then roast and grind, then the pour and bloom. Sound on for the narration.

Check it out in the website linked here

Built from editable parts and animated with keyframes

Scene 1: preparation, lift, a tucked pose and a compressed landing

Challenge solved: FreeMoCap crashed my laptop on the wave recording, so I keyframed the wave by hand in the Graph Editor.

Character from parts

Separate limbs and parented controls. An object hierarchy with keyed controls, not a skinned armature.

Keyframed motion

Crouch, push-off and landing, with follow-through in the hat, braids and basket. Editable in the Graph Editor.

Props that act together

The hand follows the grinder crank. Cherries, beans and the scoop follow timed actions.

Procedural streams

Bezier curves driven by Python scripts, an idea from the Week 3 lecture, instead of a fluid simulation.

Self-explored: two render layers, joined with Alpha Over

1 Background layer

The girl is hidden, but her shadow contribution is kept.

2 Girl layer

Real alpha from Film Transparent, with the scene as a holdout.

3 Alpha Over result

Girl placed over the full background, factor 1.0.

Why it matters: both passes use the same camera and frame, so they line up exactly. Frame 280 is verified at 1920 × 1080, the girl, background and composite are saved as separate outputs, and the full composite is used in the final Scene 1 episode.

Sound, captions and AI use are all declared

Sound and captions

- Script written by me
- My own voice, pitch altered with ChatGPT
- Music and effects fetched with ChatGPT, mixed by me in Canva
- Captions timed by me in Canva
- Narration, music and effects synced on Canva tracks

Part	Made by	What was done
Modelling and animation	Me, in Blender	Characters, islands, props and keyframes
Blender steps and fixes	ChatGPT, with me	Step-by-step instructions, scripts and error fixes
Narration	Me, plus ChatGPT	I recorded my voice; ChatGPT altered the pitch
Music and effects	ChatGPT, mixed by me	ChatGPT supplied them; I combined them with the video in Canva
Captions	Me using Canva	I timed each caption to my narration by hand
Website	Me, then Claude	I built it; Claude helped enhance, animate, push to GitHub and deploy

Critique: AI was quick for instructions, fixes and first drafts, but every result still needed re-work, and a pitch-shifted voice can sound slightly processed.

A local website brings the films together

The completed BLOOM home page, highlighting the banner image.

1. **Click the cup to begin**

   A playful landing that scrolls to the episodes.

2. **Episode cards**

   Each poster opens the film in a pop-up player.

3. **Captions and keyboard access**

   Captions on every episode; Esc closes the player.

4. **Behind the scenes**

   A page that shows who made what, own work or AI.

What worked, and what I would improve next

A What worked

- One character and palette across film, posters and website
- Separate layers kept the compositing flexible
- AI use is stated openly on the site and in this deck

! Limits today

- Some preview renders are 960 × 540, not full resolution
- Procedural streams simplify real fluid behaviour
- Large video files slow the first playback

> Future episodes

- Grow BLOOM into a series: the girl delivers coffee to castles in the clouds
- Re-render Scene 3 and its poster at 1920 × 1080
- Record narration that needs no pitch-shifting

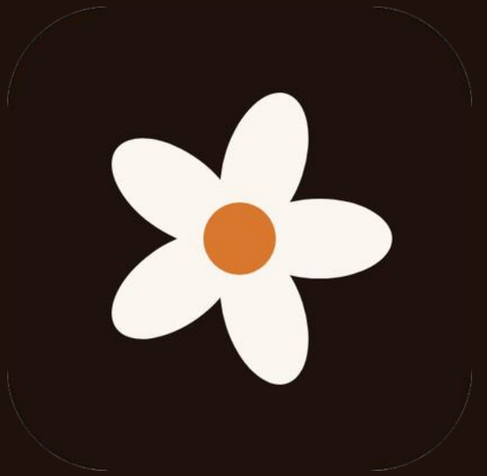

Thank you. Questions?

Appendix: website and episode tests

Test	How I checked it	Expected result	Result
Navigation	Clicked every link in the navigation bar on each page	Each link opens the right page and the current page is marked	**Pass**
Episode player	Opened each poster card and used play, pause, seek and mute	The episode plays with its sound, and every control works	**Pass**
Play all	Started the play-all option	The three episodes play in order	**Pass**
Captions	Watched each episode with captions on	Captions appear on screen in time with the narration	**Pass**
Video quality	Watched each episode in the website player	Renders, compositing and text display as expected	**Pass**
Keyboard access	Used Tab, the skip link and the Escape key	All controls can be reached, and Escape closes the player	**Pass**
Screen sizes	Resized the browser down to phone width	I Did not make website responsive; it is made only to be viewed in desktop. So, it should not be responsive	**Pass**
Behind the scenes page	Opened the page from the navigation bar	AI use and tools are credited	**Pass**

Appendix: assignment cover and declaration

Name: Anugraha Jawahar
Student ID: 550859969
Unit and tutorial: COMP5415, Alex Hao | Tutorial 02 - Time 8-9 pm
AI acknowledgement: attached, with the prompts used
Declaration and signature: Anugraha Jawahar
Date: Submitted before 21st october 2026.
